THE STANDARD PRODUCT FOR THE SUPPLY AND
DISTRIBUTION LOGISTICS IN THE AUTOMOTIVE INDUSTRY

inconso – Your partner for consulting and software in logistics

//// inconsoWMS Automotive

inconsoWMS AUTOMOTIVE

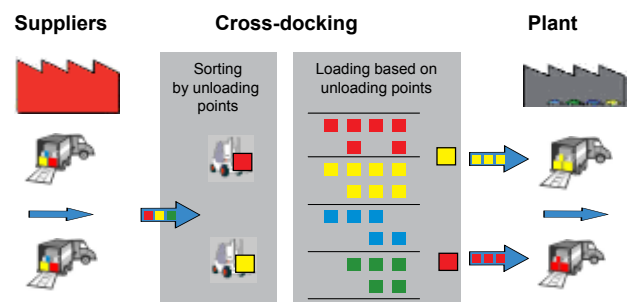

//// For the supplier industry and logistics service providers

inconsoWMS Automotive, the standard product for supply and distribution logistics in the automotive industry, offers all the functions of a modern logistics software for suppliers and logistics service providers. The possibility to cover n-to-n relationships to pre-suppliers, logistics service providers, suppliers and OEM is a major part of the inconsoWMS Automotive. Not only is the product delivered, the delivery itself is the system. To take into account the extremely high demand for delivery assurance, all containers are compared per barcode or RFID with the delivery notes. All internal transport from goods receipt and storage through to the store-out and loading are checked in order to guarantee a quick identification and security against an erroneous removal. Through simple configuration with the Business Logic Interpreter, individual process steps can be skipped in order to shorten the processing times depending upon the receivers, suppliers, item groups or individual items. In the especially sensitive area of security relevant parts, the serial numbers of the sequencing of the production number can be recorded and compared in a single step. An integrated interface manager offers a comprehensive flexibility in the area of communication with customers, suppliers and in-house systems. All the industry standard formats such as VDA, ODETTE

or EDIFACT are available. In addition, individual formats can also be realized.

//// Multi-step Cross Docking – Consolidation of logistics functions for the plants

Considering a high process and supplier assurance while optimizing costs optimally, it is important to generate the highest possible synergy effects for the supply to the plants. inconsoWMS Automotive is the right software solution for the required processes within a consolidation warehouse so that the goals can be reached.

inonsoWMS Automotive

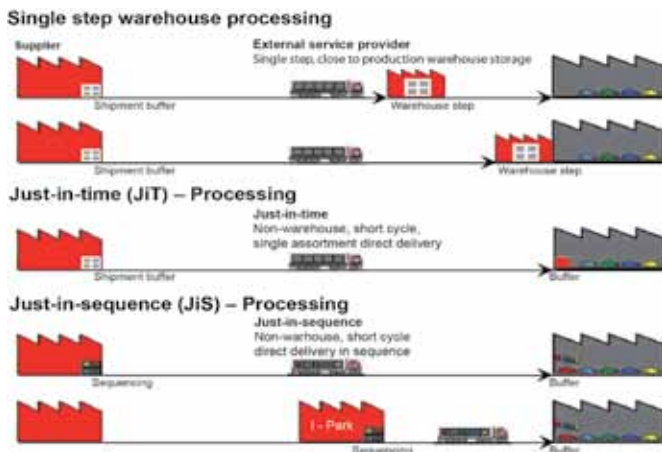

The standard product for the supply and distribution logistics in the automotive industry

JUST-IN-SEQUENCE

//// So that the chain doesn't break

When the number of production variations increases and the production increases in complexity, the economics and management of complexity promises: the synchronous production.

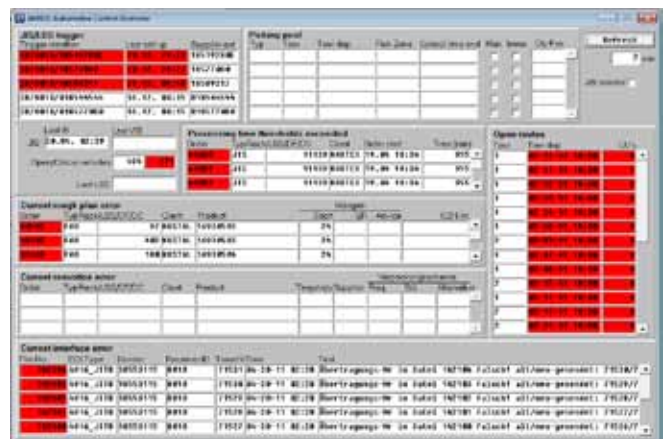

The inonsoWMS Automotive JIS module covers the processing of production synchronous supply call-offs of the customers, supports the planning of JIT/JIS deliveries and creates orders from the call-offs. Along with the delivery forecast and range lists, the forecast data can be used for the delivery planning. On the basis, the forecast data can also be completed as a manual, emergency process.

//// Order status at a glance: the dashboard

Via a central dashboard, the user receives a complete overview about the data communication, the processing times of the orders, the picking statuses, the trip departures and the inventory situation.

For the required comfort, configurable warning thresholds and colors as well as the direct branching in the detailed masks for the further processing are available. In parallel, further detailed statuses for special tasks such as JIS call-offs or assembly provide the required transparency of the processes.

//// Transparency and control over the supply chain

The pre-supplier control module was developed especially for the monitoring of the supply chains. With this application, the complete procurement management of the supply chain can be represented. In addition, invoices and credit note processes can be managed. In the delivery structure, the setup of article and building groups and the definition of which suppliers delivering individual parts are defined. On the basis of this delivery structure and considering each of the transport times and inventory situations (warehouse inventories, range checks, minimum and security stocks), the original goods receiver transferred delivery call-ups are broken down and prepared for each individual supplier.

/// Invoicing logistics services – simple and secure with inconsoLSA

The invoicing of logistics services in a conventional manner is expensive and often error-prone. With the growing offer of value-added services and its processes, the risks increase.

With inconsoLSA, a standard product focused on the specific requirements of logistics service providers that has been successfully proven in practice is available. It is designed as an automatic system for invoicing logistics services performed for third parties. The basis for the invoicing is the inventory information and individual tasks and can be taken over via defined interfaces from the operative systems in any granularity or manually entered. In inconsoLSA, this information is used for invoicing based on the defined prices, invoicing rhythm and algorithms. The parallel created and freely configurable individual tasks provide for the required transparency provided to customers.
